Nano Saws

WARNING: The edges of this saw are sharp. Please take care when handling this cutting tool in order to avoid injury. Remove all fret tab leftovers with a file. Please use eye protection.

These saws must be used with a hobby knife handle. Tighten the jaws of the handle as much as possible. This saw will cut through plastic, wood, resin and even some soft metals. The saw is very sharp and it is most effective when used with minimum pressure. Allow the weight of the saw to do the work, **do not put too much pressure on it** (it is not a knife!). Pushing the saw into the material will cause the teeth to bite in deep and the saw may seize which in turn can cause damage to both the blade (especially the fine blades) and the material.

The set includes 6 saw blades:

2 Curved saws - these can be run along a ruler as pictured above. Two sizes are included - the narrower blade can be used to follow curved edges.

3 Tapered saws - these can be used to make piercing cuts - drill a suitable hole first and use it as a starting point for the cut.

1 Straight saw. This saw can be used to make long straight cuts.

Use the narrow blade carefully.
